Using iterative methods for local solves in Asynchronous Schwarz methods.

Pratik Nayak

Joint work with Ichitaro Yamazaki and Hartwig Anzt

Doctoral candidate at Karlsruhe Institute of Technology.

Iterative methods.

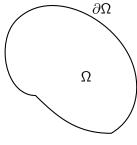

Figure: Generic Domain

Problem:

$$\mathcal{L}x = f \text{ in } \Omega; \qquad \mathcal{B}x = g \text{ on } \partial \Omega$$

Linear system:

$$Ax = f$$

Pratik Nayak

2

Stationary iterative method:

$$x^{k+1} = Bx^k + c$$

For convergence, $\rho(B) < 1$.

A (10) N (10)

Schwarz methods

- Initially used to prove convergence of the Poisson problem for general domains (Schwarz, 1870). Slow convergence.
- ② Gained popularity with parallel computers.
- ③ Restricted additive Schwarz methods: An improvement of the parallel version of the Schwarz method for faster convergence.

- 4 回 ト 4 三 ト 4 三 ト

Restricted Additive Schwarz methods

Used widely as a preconditioner:

$$M_{RAS}^{-1} = \sum_{j}^{N} \tilde{R}_{j}^{T} A_{j}^{-1} R_{j}$$

Group unknowns into subsets:

$$x_j = ilde{R}_j x, \ j = 1, ..., N$$

 \tilde{R}_j is the rectangular Restriction matrices which corresponds to a non-overlapping decomposition.

Solve each subset(subdomain) independently and communicate between each "iteration".

(4 回) (4 回) (4 回)

Restricted Additive Schwarz methods

RAS:

$$x_{p}^{k+1} = x_{p}^{k} + \sum_{j}^{N} \tilde{R}_{p}(R_{j}f - (R_{j}AR_{j}^{T})^{-1}R_{j}x^{k})$$

Advantages:

- Saves communication compared to Additive Schwarz.
- Reduced iteration count compared to Additive Schwarz.

æ

How high can we go ?

- **1** Two tolerances are at play: Global tolerance and local tolerance.
- I Higher the global tolerance, faster the overall convergence.
- Sut this is not the case for local tolerance. It depends on:
 - Condition number of the local subdomain matrices.
 - ② Can vary for each subdomain.
 - It as to be lower than global tolerance (?)

Motivation for Optimized Schwarz

Problem:

$$\mathcal{L}x = f \text{ in } \Omega; \qquad \mathcal{B}x = g \text{ on } \partial \Omega$$

Impose artificial boundary condition on interface to accelerate convergence. Advantages:

• Faster convergence than RAS.

2 Possible improved performance in the asynchronous case.

Disadvantages:

- Current theory only convergent for some physical problems with certain conditions (Laplace, Convection-reaction-diffusion)
- Parameters can be difficult to tune.

Current and Future work

General framework for Schwarz decomposition methods.

- Using deal.ii and p4est develop a framework for general finite element solution.
- Will have the ability to impose custom artificial boundary conditions.
- S Easily use adaptive mesh refinement.
- Theoretically" should scale well.
- **9** Use Ginkgo as fine-grained solver: Offloading to GPU also possible.
- 2 Load imbalance characteristics for RAS and possible improvements for asynchronous.
